25X1

The term "Shosse" as used on the Soviet maps designates a hard surface, all weather road. The construction may be paving block, driven stone, or asphalt surface. 25X1

On Soviet maps of larger scale than 1:100,000, the red color (fill) is used for hard surface roads, the black is used for improved roads. On smaller scale maps, red includes the hard surface autostrada and shosse. Any small scale map has its own symbolization. Speaking of topographic maps, a thick black line means an improved earth road, a thin black line a dirt road. The latter dirt road is not maintained.

25X1

The "improved dirt roads" which are not passable after heavy rain, have a total width from drainage ditch to drainage ditch, of 8 to 10 meters and are graded so that there is a shoulder angle of about ten degrees. These "improved dirt roads" may have a loose surface cover of cobblestones, crushed rock, or gravel. In some instances of better construction, the soft earth crown may be covered with a coarse (sharp) rock and then surfaced with a gravel or sand fill. 25X1

there is very little mechanical equipment for roads in the USSR. 25X1
Practically all work is hand labor.

SECRET/SECURITY INFORMATION

- 3 -

Country roads are usually 8-10 meters wide (from center to center of drainage ditch) with shoulders at a 10° angle. On each side of the road is a level stretch two meters wide which could possibly be used as an alternate road in bad weather. However, where the road passes through cultivated areas, the farmers plant their fields up to the edge of the drainage ditch, taking in the two-meter stretches on the sides of the road. "Improved" country roads actually have little "improvement". Collective farmers contribute six days of labor per year to the maintenance of local and rayon roads. An improved road from Kirovograd to Poltava was under construction in 1950 and was built as follows: Crushed stone was laid on a base of sand; gravel was used to fill in the gaps between the stones, and the whole was covered with a layer of sand.

In 1949, collective farmers in the Ukraine, were engaged in the construction of a hard surfaced highway between Kiev and Odessa. The new highway will by-pass Kirovograd to the east.

asphalt roads in the USSR:

25X1

- (a) Moscow-Minsk
- (b) Moscow-Khar'kov
- (c) Riga-Yelgava-Siauliai
- (d) Yelgava-Liepaja
- (e) Orsha-Mogilev
- (f) Orel-Bryansk
- (g) L'vov-Sambor

Road construction is carried out to a great extent by collective farmers who have little or no experience in this type of work. Thus, although plans for road building are well prepared, actual construction is poor.

Thousands of highway bridges were destroyed during the German retreat from the USSR. These bridges were temporarily repaired by Soviet Army Engineers, and were subsequently turned over to civil authorities. The latter have as yet made no efforts to replace the temporary bridges with permanent structures.

Soviet trucks are overhauled once annually.
